April solar power generation was 2,847,604kWh, 12% below the P50 forecast due to a below-average number of productive daylight hours from heavy rainfall in eastern and western Japan and Okinawa, suspensions of renewable energy purchases, and a decrease in power generation efficiency resulting from panel failure at the Ichigo Nago Futami ECO Power Plant. Due to the operator-guaranteed base revenue, there is no material impact of the panel failure on earnings.

<sup>1</sup> Forecast Power Generation is a 50% probability mean annual production forecast (P50 forecast), calculated by an independent, third-party technical consulting firm, that serves as the base forecast for each solar power plant’s operating plan.

<sup>2</sup> CO2 reduction is calculated as 0.438kg CO2 per kWh, except for the Ichigo Nago Futami ECO Power Plant for which it is calculated as 0.672kg CO2 per kWh, using the adjusted CO2 emission factor disclosed by the Ministry of Environment on March 1 of each year as a fixed constant until February of the following year.
